PERFORMANCE AND EFFICIENCY

COMPRESSED AIR REPLACEMENT

Air-based applications require a combination of air pressure and volumetric flow. Compressed air is inefficient for most applications over 4HP because compressors produce more pressure than needed and not enough flow to be effective without wasting energy.

JetAir's DirectDriveTM blowers output the most efficient balance of pressure and flow available. JetAir's efficiency advantage can significantly reduce or even eliminate compressor capacity, giving you better performance for less money.

INNOVATIVE TECHNOLOGY

JetAir is #1 in electrical efficiency because of our high-speed DirectDriveTM motor technology, implementation of modern impeller design, and smart controls. Depending on your application, JetAir's blowers can reduce compressed air electrical consumption by as much as 70%. In fact, our systems save so much they can pay for themselves in 4 to 6 months and often offer an ROI of over 100%. That means thousands of dollars that would have gone into thin air are now bolstering your bottom line.

ENGINEERING PARTNERSHIP

JetAir manufactures high-speed blowers, the most comprehensive line of air knives, and complete systems. We serve industries including food & beverage, pharmaceutical, industrial, and electronic across the globe. JetAir's Application Engineers are trained to design effective and efficient solutions for new lines, execute line performance upgrades, and replace compressed air blown to atmosphere.
